Geology and Genesis of Major Copper Deposits and Districts of the World J. W. Hedenquist,Michael Harris,Francisco Camus,2012 Copper deposits are heterogeneously concentrated in Earth s upper crust resulting in areally restricted copper provinces that were generated during several discrete metallogenic epochs over time intervals of up to several hundred million years Each metallogenic epoch introduced its own deposit type s of which porphyry copper and related skarn followed by sediment hosted stratiform copper and then iron oxide copper gold IOCG are globally preeminent Nonetheless genesis of the copper provinces remains somewhat enigmatic and a topic of ongoing debate **Geodynamics and Ore Deposit Evolution in Europe** D. Blundell,N. Arndt,P.R. Cobbold,C. Heinrich,2006-02-07 This book presents a new synthesis of the major metallogenic provinces of Europe and the geodynamic processes involved that can lead to the formation of world class ore deposits It represents the culmination of a 5 year research programme GEODE set up by the European Science Foundation that brought together researchers across Europe from a wide range of disciplines into collaborative research projects They focused on five metallogenic provinces across Europe the Precambrian Fennoscandian Shield the Upper Palaeozoic Urals the Variscides of France and SW Iberia the Alpine Balkan Carpathian Dinaride belt and sediment hosted deposits of Europe Because of the long and well known tectonic history of Europe and the diversity of ore deposits linkages between geodynamics and ore deposit evolution have been established and new insights into mineralizing fluids and ore formation processes have been gained Presented as a set of individual review papers and a final synthesis this book offers a coherent and structured appraisal of geodynamics and metallogeny in Europe with valuable lessons for mineral exploration and research throughout the world *Andean Copper Deposits* Francisco Camus,Richard Petersen,1996

Tectonic Growth of a Collisional Continental Margin Kenneth D. Ridgway,2007 The convergent margin of southern Alaska is considered one of the type areas for understanding the growth of continental margins through collisional tectonic processes Collisional processes that formed this margin were responsible for multiple episodes of sedimentary basin development subduction complex growth magmatism and deformation Two main collisional episodes shaped this Mesozoic Cenozoic continental margin The first event was the Mesozoic collision of the allochthonous Wrangellia composite terrane This event represents the largest addition of juvenile crust to western North America in the past 100 m y The second event is the ongoing collision of the Yakutat terrane along the southeastern margin of Alaska This Cenozoic event has produced the highest coast mountain range on Earth Saint Elias Mountains the Wrangell continental arc and sedimentary basins throughout southern Alaska Active collisional processes continue to shape the southern margin of Alaska mainly through

crustal shortening and strike slip deformation large magnitude earthquakes and rapid uplift and exhumation of mountain belts and high sedimentation rates in adjacent sedimentary basins This volume contains 24 articles that integrate new geophysical and geologic data including many field based studies to better link the sedimentary structural geochemical and magmatic processes that are important for understanding the development of collisional continental margins Publisher s website

Origin and Evolution of Sedimentary Basins and Their Energy and Mineral Resources Raymond A. Price,1991-01-08 Published by the American Geophysical Union as part of the Geophysical Monograph Series Volume 48 The International Lithosphere Program was launched in 1981 as a ten year project of interdisciplinary research in the solid earth sciences It is a natural outgrowth of the Geodynamics Program of the 1970 s and of its predecessor the Upper Mantle Project The Program Dynamics and Evolution of the Lithosphere The Hazards is concerned primarily with the current state origin and development of the lithosphere with special attention to the continents and their margins One special goal of the program is the strengthening of interactions between basic research and the applications of geology geophysics geochemistry and geodesy to mineral and energy resource exploration and development to the mitigation of geological hazards and to protection of the environment another special goal is the strengthening of the earth sciences and their effective application in developing countries The origin and evolution of sedimentary basins is an obvious focus of the International Lithosphere Program because it is fundamentally a problem in the dynamics and evolution of the lithosphere and moreover it provides special opportunities for strengthening the interactions between basic research
