

DESIGN AGAINST FATIGUE LOAD

FLUCTUATING STRESSES

In many applications, the components are subjected to forces, which are not static, but vary in magnitude with respect to time. The stresses induced due to such forces are called *fluctuating stresses*. It is observed that about 80% of failures of mechanical components are due to 'fatigue failure' resulting from *fluctuating stresses*.

Examples of parts in which fatigue failures are common are transmission shafts, connecting rods, gears, vehicle suspension springs and ball bearings.
