Global Tropical Cyclogenesis:

Global Tropical Cyclogenesis E.A. Sharkov, 2001-04-18 Tropical cyclones are the most impressive and best phenomenon of the tropics and this book fills a need for a thorough detailed book on the subject concentrating on the remote sensing results on both initial and mature forms of tropical cyclones It provides a comprehensive description of the physical geophysical and meteorological foundations of global tropical cyclogenesis The author emphasises the physical aspects necessary to judge the possibilities and limitations of monitoring mitigation methods and includes numerous applications and illustrations from up to date airborne and satellite experiments

GLOBAL TROPICAL CYCLOGENESIS Eugene A. Sharkov, 2011-12-09 Cyclogenesis research is a central issue of meteorology and climatology This book gives a deep specific view and fundamentally and effectively contributes to the discussion of the problem It treats cyclogenesis as a stochastic process in a very fundamental way Since the publication of the first edition of Global Tropical Cyclogenesis in 2001 a number of important scientific results has been obtained using methods and techniques proposed in that first edition There is therefore a great need for a revised 2nd edition of this book It is based on scientific findings from the performance of satellite data processing and a series of scientific marine expeditions to the tropics as part of major Russian Science Academy research projects Professor Eugene A Sharkov has proposed the main approaches experimental techniques and theoretical explanations for many scientific findings as well as new methods of satellite processing He is recognized as a leading scientist in the field of microwave remote sensing of terrestrial surfaces and atmosphere and in nonlinear geophysics origination and evolution of atmospheric catastrophes and has published around 100 scientific works on the problems of global tropical cyclogenesis structure and evolution

Evaluating Tropical Cyclogenesis Forecasts from Four Global Numerical Models Daniel Halperin, 2012 ABSTRACT Tropical cyclone TC forecasts rely heavily on output from numerical models Each model in the suite of models used by forecasters has its own strengths and weaknesses Some

research has investigated the skill of the various models with respect to track with the assumption that a TC already exists. However, little research has considered how well or poorly global models forecast TC genesis. Some studies have considered the Western North Pacific basin, but there have been numerous upgrades to the numerical models since then. A few studies examined the North Atlantic basin, but they analyzed a relatively small sample of storms. This paper will analyze TC genesis forecasts in four global models: CMC GFS, NOGAPS, UKMET, over seven seasons (2004-2010) in the North Atlantic basin. All model indicated TCs will be counted and classified as a hit, false alarm, or an incorrect timing event. We will also consider miss events. The method of finding TCs in the model environment is based on a mixture of methods used previously in the literature. Hits are defined as when a model predicts genesis within 24 hours of the National Hurricane Center Best Track genesis time and within 5 latitude and longitude of the Best Track genesis location. A false alarm is defined as a model indicated TC that never develops. An incorrect timing event is defined as when the model is predicting genesis at a location where a TC already exists in the Best Track, but the timing of genesis is off, i.e. more than 24 hours from the Best Track genesis time. Results will show which model best predicted TC genesis, with the acknowledgement that the best model can change from year to year, and whether or not model performance has improved over time. Basic statistics will be conducted on the results. The results will be subdivided into geographical regions and analyzed spatially and temporally. This provides insight regarding regions where a model performs best or worst, and whether forecast skill decreases with increasing forecast hour, as one would expect. Future research will investigate the whys behind the results presented here. Synoptic patterns will be analyzed, and commonalities among each category (hits, false alarms, misses, and incorrect timing events) will be investigated.

World Atlas of Natural Disaster Risk Peijun Shi, Roger Kasperson, 2015-03-11. This is the first English language atlas to systematically introduce the environment hazard, vulnerability, and risk mapping for 11 natural disasters: i.e. earthquake, volcano, landslide, flood, storm surge, sand dust storm, tropical cyclone, heat wave, cold wave, drought, and wildfire, and risk mapping for multi-hazard disaster in the world. The above 11 hazards are assessed and mapped at grid unit, comparable geographic unit, and national unit, and the multi-hazard is assessed and mapped at grid unit and national unit. The expected annual mortality and/or affected population risks, and expected annual economic loss and/or affected property risk of 11 hazards and multi-hazard of the world at national level are unprecedentedly derived and ranked. The atlas can be a good reference for researchers and students in the field of natural disaster risk management and risk governance, and enterpriser and risk manager, as well to understand the global natural disaster risk. Prof. Peijun Shi works at Beijing Normal University, China. Prof. Roger Kasperson works at Clark University, USA.
