In this paper, we study factorization in an integral domain  $R$ , that is, factoring elements of  $R$  into products of irreducible elements. We investigate several factorization properties in  $R$  which are weaker than unique factorization.

### Introduction

Let  $R$  be an integral domain with quotient field  $K$ . In this paper, we study factorization in  $R$ , that is, factoring elements of  $R$  into products of irreducible elements. The classical situation is when this factorization exists and is unique up to order and associates, that is, when  $R$  is a unique factorization domain (UFD). This case has been studied extensively, and there are many excellent accounts of the theory ([14, 17, 28-30], for example). In this paper, we investigate various related factorization properties weaker than unique factorization. Our goal is to give a careful study of these properties and to give many examples, each as elementary as possible.

We first define the various factorization properties which we will study here. Following Cohn [13], we say that  $R$  is *atomic* if each nonzero nonunit of  $R$  is a product of a finite number of irreducible elements (atoms) of  $R$ . We say that  $R$  satisfies the *ascending chain condition on principal ideals* (ACCP) if there does not exist an infinite strictly ascending chain of principal integral ideals of  $R$ . The domain  $R$  is a *bounded factorization domain* (BFD) if  $R$  is atomic and for each nonzero nonunit of  $R$  there is a bound on the length of factorizations into products of irreducible elements. We say that  $R$  is a *half-factorial domain* (HFD) if  $R$  is atomic and each
