

PHILIPPINE EAGLE

Philippine Islands of Luzon, Samar, Leyte and Mindanao

STATUS: Fewer than 500 left in the wild

- One of the largest eagles in the world and globally considered an critically endangered since 1969, it was adopted and regularly hunted by Filipino boxing star Manny Pacquiao.
- Each pair needs 65 to 120 sq km to raise a single chick successfully, making the species highly vulnerable to the rampant deforestation of recent decades.
- Breeding eagles favour tall trees with open crowns. Nests are built at heights ranging from 24m to 48m and often used for consecutive nestings.

GREY-SHANKED DOUG LANGUR

Central Vietnam

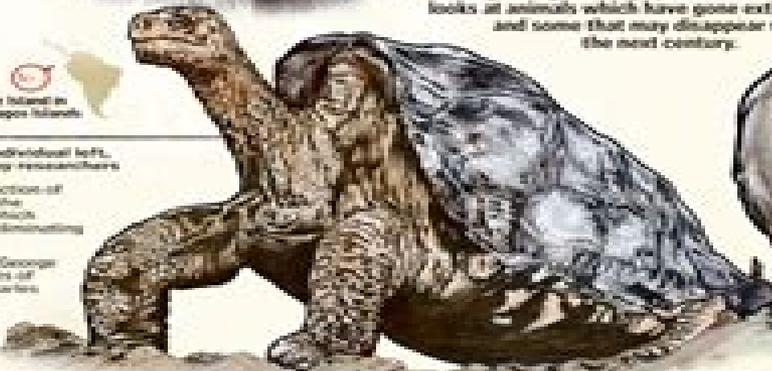

STATUS: Number estimated at 150 to 700

- These primates live in the Central Highlands of Vietnam where almost 50,000 ha of forest are lost annually due to logging and agricultural expansion. This creates a more fragmented habitat and population structure over time.
- Tend to hide mistletoe in the canopy rather than blowing when hunted, making them particularly vulnerable. They are hunted for bushmeat, traditional medicines and for sale as pets.

PINTA ISLAND GIANT TORTOISE

Santa Cruz Island in the Galapagos Islands

STATUS: One last known individual left, named Lonesome George by researchers

- Ecologists blame the extinction of tortoises on Pinta Island on the introduction of feral goats which devastated the vegetation, eliminating their source of food.
- At a healthy 90 years old, George was paired with two females of a different species at the Charles Darwin Research Station on Santa Cruz Island but eggs failed to hatch.

IBERIAN LYNX

Southern Spain

STATUS: About 95 to 145 adults

- Continuing decline partly due to severe depletion of its primary prey, the European rabbit, by disease and over-hunting.
- Destruction, deterioration and alteration of their habitats have fragmented the lynx populations. Examples include the planting of Mediterranean reedlands and the opening up of roads and forest tracks in previously remote areas.

BALI DOLPHIN

Indragiri River, Java, Indonesia

STATUS: Last documented sighting in 2002

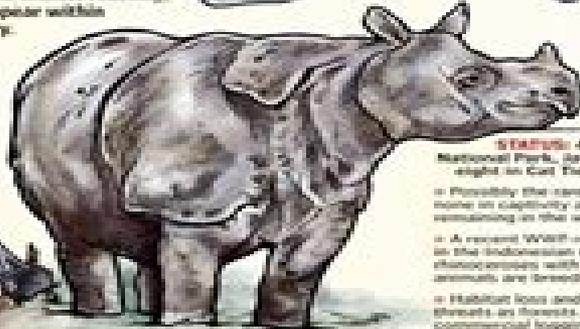

- In late 2006, a comprehensive visual and acoustic survey failed to find a single dolphin in the Indragiri River - evidence that suggests the subspecies might already be extinct.
- The dolphins faced dwindling local numbers due to overfishing by humans and degradation of habitat by pollution. They were often struck by boats in the industry-choked river.

THE LAST OF THEIR KIND

Scientists are warning that the Earth may be at the beginning of the sixth mass extinction. In a report published by scientific journal *Nature* last week, scientists calculated that current extinction rates are almost 80 times higher than non-mass extinction rates, due to the burgeoning human population. The *Strait Times* looks at animals which have gone extinct recently, and some that may disappear within the next century.

JAVAN RHINOCEROS

Western Java, Indonesia

STATUS: 40-60 in Ujung Kulon National Park, Java, Indonesia; no more than eight in Cui Tam National Park, Vietnam

- Possibly the rarest mammal on the planet with none in captivity and two small populations remaining in the wild.
- A recent WWF-released motion-activated camera in the Indonesian national park recorded two rhinoceroses with their calves - proof that the animals are breeding, albeit in small numbers.
- Habitat loss and degradation remain the main threats as forests are cleared for agriculture and commercial logging in and around the protected areas where these animals live.

GONE FOR GOOD

Some animals that have gone extinct in the past 100 years.

GOLDEN TOAD
Once abundant in the cloud-covered tropical forests of Costa Rica, these amphibians disappeared in 1989.

PASSERINE PIGEON

Large-scale hunting led to a drastic decline in the numbers of these North American birds. It finally became extinct after the last confirmed sighting in 1912.

SCHOMBURGK'S DEER
A deer species native to Thailand. Conversion of grassland and swamp areas to agricultural land resulted in loss of habitat. Overhunting also led to its extinction by the 1930s.

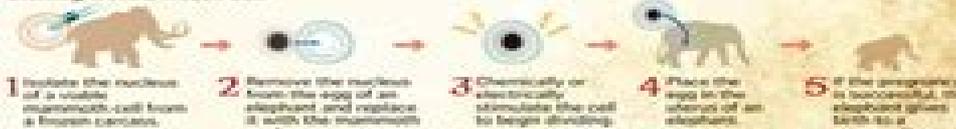

TASMANIAN TIGER
This carnivorous marsupial survived in Tasmania, Australia till 1936. Extensive hunting, introduction of dogs and human encroachment led to its eventual extinction.

JAVAN TIGER
Last confirmed sighting in 1972, intensive human encroachment led to habitat destruction and competition for available prey sources, with legends and wild dogs, excessive poaching added to the mix.

BACK TO LIFE?

Huge hurdles remain as to whether extinct species can be revived using cloning processes. In 2009, scientists managed to decode 70 per cent of the mammoth genome. Shows here are possible ways that the extinct mammoth may be cloned.
